

Claim 17. A disposable lighter, comprising:

a lighter body for storing fuel;
a mounting frame, which is sealedly affixed on top of said
lighter body, comprising a first and a second supporting wall
5 upwardly extended from two sides of said mounting frame;
a vertical spring chamber between said first and second
supporting walls of said mounting frame, said vertical spring
chamber with a height shorter than said first and second
supporting walls;
10 a flint spring being received in said spring chamber;
a gas lever being pivotally mounted between said first and
second supporting walls and having a central cutout to allow
said spring penetrating therethrough to insert into said spring
chamber, said gas lever further integrally providing a thumb
15 pusher at one end thereof and forming a lifting hole engaged
with a gas nozzle at the other end;
a gas valve with said gas nozzle extending upwards above
said mounting frame being installed inside said mounting frame,
said gas nozzle being engaged with another end of said gas
20 lever, so that when said thumb pusher is pushed downwardly, said
other end of said gas lever lifts said gas nozzle to release gas
from an interior of said lighter body via said gas valve;
an ignition device comprising a flint and a striking wheel,
wherein said flint is supported on top of said flint spring with

a bottom portion thereof inserting into said spring chamber,
said striking wheel which has a circumferential coarse striking
surface being positioned right above said flint by rotatably
mounting between said first and second supporting walls, so that
5 said flint is pressed downwardly by said circumferential coarse
striking surface of said striking wheel, and that said flint is
relatively pressed by said flint spring upwards to urge against
said circumferential coarse striking surface of said striking
wheel, wherein said striking wheel further comprises two
10 circular discs integrally formed at two sides of said striking
wheel; and

a U-shaped wind shield extends over said first and second
supporting walls to cover said gas nozzle and said first and
second supporting walls, said wind shield having an a U-shaped
15 side wall which has a round end portion and two wing portions
extending from said round end portion, and a first and a second
L-shaped bent-edge members which are respectively and
perpendicularly bent from a top side and an end side of said
wing portions, said striking surface at an elevation lower than
20 said bent-edge members, wherein said first and second bent-edge
members are respectively extended from a top wall along said top
side and said end side of each of said wing portions, a top end
corner of each of said wing portions forming a curved corner
which has a curvature matching at least a quarter of a

circumference of said striking wheel, so that said striking
wheel is sidewardly covered by said two wing portions of said
windshield, wherein said first and second bent-edge members of
said windshield are inwardly extended to form two protecting
5 bent-edge members for better striking contact by increasing a
contact area with a user's thumb.
